

AbleSpace Assessment Part 2: Product Understanding

August 20, 2026

Section 1: The Workflow Explanation

Step 1: Accessing the Session

The workflow begins on the Caseload tab. The user finds a specific student from the list and clicks the "Take Data" button in the Actions column to start a real-time data collection session.

Figure 1: The Caseload page with the "Take Data" button highlighted

Step 2: Selecting the Objective

Once inside the session, the left panel shows the student's active IEP goals (e.g., Social Studies, Writing, Math, Reading, Toileting, Behavior). The user clicks the goal they want to track data for during this session, and a green indicator marks which goal is currently active. The top bar also shows "Accommodations" and "Services Not Tracked" links, so that information stays visible without leaving the session.

Figure 2: Selecting the Objective

Step 3: Capturing the Data

The central panel shows the Capture grid for the selected goal, with tabs for Capture, Graph, Stats, and Info. In Capture mode, the user logs each trial with a simple counter: pressing "+" adds a point for a correct or observed response, and "Undo" removes the last entry if a mistake is made. Trials can be moved through one at a time using the trial navigator, and a new phase can be started with "+ Phase." Switching to Graph or Stats turns the same data into a trend line or a numeric summary, so progress can be checked without leaving the goal.

Step 4: Adding Qualitative Notes

After the numbers are logged, the user scrolls down to the notes panel to add context. They can type observations directly into the editor, or use the "Ask AI" feature to help summarize the session.

Section 2: UX/UI and Functionality Improvements

These ideas are based on how the app is actually used: a teacher on a shared tablet, often with a student right in front of them, trying to log data fast without losing focus. Each point includes a quick note on how much work it would take versus how much it would help.

1. Bigger, Safer Tap Targets for the Counter

The Problem: The "+" button and the "Undo" link sit close together and are on the small side. On an iPad, with attention split between the screen and the student, it's easy to tap the wrong one or miss the undo option, and a lost data point can't always be added back later.

The Solution: Make the "+" button bigger and full-width, and replace the small "Undo" text with a short toast message that appears after every tap ("Trial logged · Undo") and stays on screen for a few seconds. This keeps the fix-it option easy to find without adding an extra click.

Effort/Impact: Low effort, high impact — just a component and interaction tweak, no change to the data model.

2. "Bulk Action" Buttons for Repeated Trials

The Problem: If a student does well on the same task several times in a row, the teacher still has to tap "+" once per trial, which slows things down for goals that get tracked often.

The Solution: Add a small "+5" or "Add multiple" button next to the main "+" so a run of the same result can be logged in one tap, with the option to undo the whole batch at once.

Effort/Impact: Low to medium effort, high impact for goals tracked at high frequency.

3. Progress Indicators on the Goals List

The Problem: Looking at the Goals panel, it's hard to tell at a glance which goals already have data for today and which ones still need attention.

The Solution: Add a small checkmark or a filled progress ring next to each goal once at least one trial has been logged for it in the current session. This lets the teacher scan the whole session's progress without opening every goal.

Effort/Impact: Low effort, medium to high impact — mostly a UI state built from data that's already being tracked.

4. A Trial History Strip

The Problem: The trial navigator only shows one trial at a time, so there's no quick way to see how the whole session went (steady improvement, mixed results, and so on) without stepping through every trial one by one.

The Solution: Add a row of small colored dots above the capture area, one per trial, color-coded by outcome. This gives a quick read on the session at a glance and could also work as a shortcut to jump to a specific trial.

Effort/Impact: Medium effort (a new small component using data already collected), medium to high impact for tracking progress.

5. A Collapsible "Upgrade to Pro" Banner

The Problem: The upgrade banner in the sidebar takes up space permanently, which matters more on smaller tablet screens where every bit of room counts.

The Solution: Let the banner be collapsed to a small icon or dismissed for a while, so the navigation stays compact during an active session.

Effort/Impact: Low effort, low to medium impact — more of a polish fix than a core workflow change.
